AIO_ADB_SHELL

1.1 aio_adb_shell package

1.1.1 Subpackages

`aio_adb_shell.auth` package

Submodules

`aio_adb_shell.auth.keygen` module

This file implements encoding and decoding logic for Android's custom RSA public key binary format. Public keys are stored as a sequence of little-endian 32 bit words. Note that Android only supports little-endian processors, so we don't do any byte order conversions when parsing the binary struct.

Structure from: https://github.com/aosp-mirror/platform_system_core/blob/c55fab4a59cfa461857c6a61d8a0f1ae4591900c/libcrypto_utils/android_pubkey.c

```
typedef struct RSAPublicKey {
    // Modulus length. This must be ANDROID_PUBKEY_MODULUS_SIZE_WORDS
    uint32_t modulus_size_words;

    // Precomputed montgomery parameter: -1 / n[0] mod 2^32
    uint32_t n0inv;

    // RSA modulus as a little-endian array
    uint8_t modulus[ANDROID_PUBKEY_MODULUS_SIZE];

    // Montgomery parameter R^2 as a little-endian array of little-endian words
    uint8_t rr[ANDROID_PUBKEY_MODULUS_SIZE];

    // RSA modulus: 3 or 65537
    uint32_t exponent;
} RSAPublicKey;
```

Contents

- `_to_bytes()`
- `decode_pubkey()`
- `decode_pubkey_file()`

- `encode_pubkey()`
- `get_user_info()`
- `keygen()`
- `write_public_keyfile()`

`aio_adb_shell.auth.keygen.ANDROID_PUBKEY_MODULUS_SIZE = 256`

Size of an RSA modulus such as an encrypted block or a signature.

`aio_adb_shell.auth.keygen.ANDROID_PUBKEY_MODULUS_SIZE_WORDS = 64`

Size of the RSA modulus in words.

`aio_adb_shell.auth.keygen.ANDROID_RSAPUBLICKEY_STRUCT = '<LL256s256sL'`

Python representation of “struct RSAPublicKey”

`aio_adb_shell.auth.keygen._to_bytes(n, length, endianness='big')`

Partial python2 compatibility with `int.to_bytes`

<https://stackoverflow.com/a/20793663>

Parameters

- `n (TODO)` – TODO
- `length (TODO)` – TODO
- `endianness (str, TODO)` – TODO

Returns TODO

Return type TODO

`aio_adb_shell.auth.keygen.decode_pubkey(public_key)`

Decode a public RSA key stored in Android’s custom binary format.

Parameters `public_key (TODO)` – TODO

`aio_adb_shell.auth.keygen.decode_pubkey_file(public_key_path)`

TODO

Parameters `public_key_path (str)` – TODO

`aio_adb_shell.auth.keygen.encode_pubkey(private_key_path)`

Encodes a public RSA key into Android’s custom binary format.

Parameters `private_key_path (str)` – TODO

Returns TODO

Return type TODO

`aio_adb_shell.auth.keygen.get_user_info()`

TODO

Returns ' <username>@<hostname>

Return type str

`aio_adb_shell.auth.keygen.keygen(filepath)`

Generate an ADB public/private key pair.

- The private key is stored in `filepath`.
- The public key is stored in `filepath + '.pub'`

(Existing files will be overwritten.)

Parameters `filepath` (*str*) – File path to write the private/public keypair

`aio_adb_shell.auth.keygen.write_public_keyfile` (*private_key_path*, *public_key_path*)

Write a public keyfile to `public_key_path` in Android's custom RSA public key format given a path to a private keyfile.

Parameters

- **private_key_path** (*TODO*) – TODO
- **public_key_path** (*TODO*) – TODO

`aio_adb_shell.auth.sign_cryptography` module

ADB authentication using the `cryptography` package.

Contents

- `CryptographySigner`
 - `CryptographySigner.GetPublicKey()`
 - `CryptographySigner.Sign()`

class `aio_adb_shell.auth.sign_cryptography.CryptographySigner` (*rsa_key_path*)

Bases: `object`

AuthSigner using `cryptography.io`.

Parameters `rsa_key_path` (*str*) – The path to the private key.

public_key

The contents of the public key file

Type `str`

rsa_key

The loaded private key

Type `cryptography.hazmat.backends.openssl.rsa._RSAPrivateKey`

GetPublicKey()

Returns the public key in PEM format without headers or newlines.

Returns `self.public_key` – The contents of the public key file

Return type `str`

Sign (*data*)

Signs given data using a private key.

Parameters `data` (*TODO*) – TODO

Returns The signed data

Return type `TODO`

`aio_adb_shell.auth.sign_pycryptodome` module

ADB authentication using `pycryptodome`.

Contents

- *PycryptodomeAuthSigner*
 - *PycryptodomeAuthSigner.GetPublicKey()*
 - *PycryptodomeAuthSigner.Sign()*

class aio_adb_shell.auth.sign_pycryptodome.**PycryptodomeAuthSigner** (*rsa_key_path=None*)
Bases: object

AuthSigner using the pycryptodome package.

Parameters *rsa_key_path* (*str*, *None*) – The path to the private key

public_key

The contents of the public key file

Type *str*

rsa_key

The contents of the private key

Type *Crypto.PublicKey.RSA.RsaKey*

GetPublicKey()

Returns the public key in PEM format without headers or newlines.

Returns *self.public_key* – The contents of the public key file

Return type *str*

Sign (*data*)

Signs given data using a private key.

Parameters *data* (*bytes*, *bytearray*) – The data to be signed

Returns The signed data

Return type *bytes*

aio_adb_shell.auth.sign_pythonrsa module

ADB authentication using the *rsa* package.

Contents

- *_Accum*
 - *_Accum.digest()*
 - *_Accum.update()*
- *_load_rsa_private_key()*
- *PythonRSASigner*
 - *PythonRSASigner.FromRSAKeyPath()*
 - *PythonRSASigner.GetPublicKey()*
 - *PythonRSASigner.Sign()*

class aio_adb_shell.auth.sign_pythonrsa.**PythonRSASigner** (*pub=None, priv=None*)
 Bases: object

Implements adb_protocol.AuthSigner using <http://stuvel.eu/rsa>.

Parameters

- **pub** (*str, None*) – The contents of the public key file
- **priv** (*str, None*) – The path to the private key

priv_key

The loaded private key

Type rsa.key.PrivateKey

pub_key

The contents of the public key file

Type str, None

classmethod **FromRSAKeyPath** (*rsa_key_path*)

Create a *PythonRSASigner* instance using the provided private key.

Parameters **rsa_key_path** (*str*) – The path to the private key; the public key must be `rsa_key_path + '.pub'`.

Returns A *PythonRSASigner* with private key `rsa_key_path` and public key `rsa_key_path + '.pub'`

Return type *PythonRSASigner*

GetPublicKey ()

Returns the public key in PEM format without headers or newlines.

Returns **self.pub_key** – The contents of the public key file, or *None* if a public key was not provided.

Return type str, None

Sign (*data*)

Signs given data using a private key.

Parameters **data** (*bytes*) – The data to be signed

Returns The signed data

Return type bytes

class aio_adb_shell.auth.sign_pythonrsa.**_Accum**

Bases: object

A fake hashing algorithm.

The Python `rsa` lib hashes all messages it signs. ADB does it already, we just need to slap a signature on top of already hashed message. Introduce a “fake” hashing algo for this.

_buf

A buffer for storing data before it is signed

Type bytes

digest ()

Return the digest value as a string of binary data.

Returns **self._buf** – `self._buf`

Return type bytes

update (*msg*)

Update this hash object's state with the provided *msg*.

Parameters *msg* (*bytes*) – The message to be appended to `self._buf`

`aio_adb_shell.auth.sign_pythonrsa._load_rsa_private_key` (*pem*)

PEM encoded PKCS#8 private key -> `rsa.PrivateKey`.

ADB uses private RSA keys in pkcs#8 format. The `rsa` library doesn't support them natively. Do some ASN unwrapping to extract naked RSA key (in der-encoded form).

See:

- <https://www.ietf.org/rfc/rfc2313.txt>
- <http://superuser.com/a/606266>

Parameters *pem* (*str*) – The private key to be loaded

Returns The loaded private key

Return type `rsa.key.PrivateKey`

Module contents

`aio_adb_shell.handle` package

Submodules

`aio_adb_shell.handle.base_handle` module

A base class for handles used to communicate with a device.

- *BaseHandle*
 - *BaseHandle.bulk_read()*
 - *BaseHandle.bulk_write()*
 - *BaseHandle.close()*
 - *BaseHandle.connect()*

class `aio_adb_shell.handle.base_handle.BaseHandle`

Bases: `abc.ABC`

A base handle class.

`_abc_impl = <_abc_data object>`

abstract async `bulk_read` (*numbytes*, *timeout_s=None*)

Read data from the device.

Parameters

- *numbytes* (*int*) – The maximum amount of data to be received
- *timeout_s* (*float*, *None*) – A timeout for the read operation

Returns The received data

Return type bytes

abstract async bulk_write (*data*, *timeout_s=None*)

Send data to the device.

Parameters

- **data** (*bytes*) – The data to be sent
- **timeout_s** (*float*, *None*) – A timeout for the write operation

Returns The number of bytes sent

Return type int

abstract async close ()

Close the connection.

abstract async connect (*timeout_s=None*)

Create a connection to the device.

Parameters **timeout_s** (*float*, *None*) – A connection timeout

aio_adb_shell.handle.tcp_handle module

A class for creating a socket connection with the device and sending and receiving data.

- *TcpHandle*
 - *TcpHandle.bulk_read()*
 - *TcpHandle.bulk_write()*
 - *TcpHandle.close()*
 - *TcpHandle.connect()*

class aio_adb_shell.handle.tcp_handle.**TcpHandle** (*host*, *port=5555*, *default_timeout_s=None*) *de-*

Bases: *aio_adb_shell.handle.base_handle.BaseHandle*

TCP connection object.

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **default_timeout_s** (*float*, *None*) – Default timeout in seconds for TCP packets, or None

_default_timeout_s

Default timeout in seconds for TCP packets, or None

Type float, None

_host

The address of the device; may be an IP address or a host name

Type str

_port

The device port to which we are connecting (default is 5555)

Type int

_reader
TODO

Type StreamReader, None

_writer
TODO

Type StreamWriter, None

_abc_impl = <_abc_data object>

async bulk_read (*numbytes*, *timeout_s=None*)
Receive data from the socket.

Parameters

- **numbytes** (*int*) – The maximum amount of data to be received
- **timeout_s** (*float*, *None*) – When the timeout argument is omitted, `select.select` blocks until at least one file descriptor is ready. A time-out value of zero specifies a poll and never blocks.

Returns The received data

Return type bytes

Raises [`TcpTimeoutException`](#) – Reading timed out.

async bulk_write (*data*, *timeout_s=None*)
Send data to the socket.

Parameters

- **data** (*bytes*) – The data to be sent
- **timeout_s** (*float*, *None*) – When the timeout argument is omitted, `select.select` blocks until at least one file descriptor is ready. A time-out value of zero specifies a poll and never blocks.

Returns The number of bytes sent

Return type int

Raises [`TcpTimeoutException`](#) – Sending data timed out. No data was sent.

async close ()
Close the socket connection.

async connect (*timeout_s=None*)
Create a socket connection to the device.

Parameters **timeout_s** (*float*, *None*) – Set the timeout on the socket instance

Module contents

1.1.2 Submodules

aio_adb_shell.adb_device module

Implement the [`AdbDevice`](#) class, which can connect to a device and run ADB shell commands.

Contents

- `_AdbTransactionInfo`
- `_FileSyncTransactionInfo`
 - `_FileSyncTransactionInfo.can_add_to_send_buffer()`
- `AdbDevice`
 - `AdbDevice._close()`
 - `AdbDevice._filesync_flush()`
 - `AdbDevice._filesync_read()`
 - `AdbDevice._filesync_read_buffered()`
 - `AdbDevice._filesync_read_until()`
 - `AdbDevice._filesync_send()`
 - `AdbDevice._handle_progress()`
 - `AdbDevice._okay()`
 - `AdbDevice._open()`
 - `AdbDevice._pull()`
 - `AdbDevice._push()`
 - `AdbDevice._read()`
 - `AdbDevice._read_until()`
 - `AdbDevice._read_until_close()`
 - `AdbDevice._send()`
 - `AdbDevice._service()`
 - `AdbDevice._streaming_command()`
 - `AdbDevice._streaming_service()`
 - `AdbDevice._write()`
 - `AdbDevice.available`
 - `AdbDevice.close()`
 - `AdbDevice.connect()`
 - `AdbDevice.list()`
 - `AdbDevice.pull()`
 - `AdbDevice.push()`
 - `AdbDevice.root()`
 - `AdbDevice.shell()`
 - `AdbDevice.stat()`
 - `AdbDevice.streaming_shell()`
- `AdbDeviceTcp`

class `aio_adb_shell.adb_device.AdbDevice` (*handle*, *banner=None*)

Bases: `object`

A class with methods for connecting to a device and executing ADB commands.

Parameters

- **handle** (`BaseHandle`) – A user-provided handle for communicating with the device; must be an instance of a subclass of `BaseHandle`
- **banner** (*str*, *bytes*, *None*) – The hostname of the machine where the Python interpreter is currently running; if it is not provided, it will be determined via `socket.gethostname()`

Raises `adb_shell.exceptions.InvalidHandleError` – The passed *handle* is not an instance of a subclass of `BaseHandle`

`__available`

Whether an ADB connection to the device has been established

Type `bool`

`__banner`

The hostname of the machine where the Python interpreter is currently running

Type `bytearray`, `bytes`

`__handle`

The handle that is used to connect to the device; must be a subclass of `BaseHandle`

Type `BaseHandle`

async `__close` (*adb_info*)

Send a `b'CLSE'` message.

Warning: This is not to be confused with the `AdbDevice.close()` method!

Parameters `adb_info` (`_AdbTransactionInfo`) – Info and settings for this ADB transaction

async `__filesync_flush` (*adb_info*, *filesync_info*)

Write the data in the buffer up to `filesync_info.send_idx`, then set `filesync_info.send_idx` to 0.

Parameters

- **adb_info** (`_AdbTransactionInfo`) – Info and settings for this ADB transaction
- **filesync_info** (`_FileSyncTransactionInfo`) – Data and storage for this FileSync transaction

async `__filesync_read` (*expected_ids*, *adb_info*, *filesync_info*, *read_data=True*)

Read ADB messages and return FileSync packets.

Parameters

- **expected_ids** (*tuple[bytes]*) – If the received header ID is not in `expected_ids`, an exception will be raised
- **adb_info** (`_AdbTransactionInfo`) – Info and settings for this ADB transaction

- **filesync_info** (`_FileSyncTransactionInfo`) – Data and storage for this FileSync transaction
- **read_data** (`bool`) – Whether to read the received data

Returns

- **command_id** (`bytes`) – The received header ID
- **tuple** – The contents of the header
- **data** (`bytearray`, `None`) – The received data, or `None` if `read_data` is `False`

Raises

- **adb_shell.exceptions.AdbCommandFailureException** – Command failed
- **adb_shell.exceptions.InvalidResponseError** – Received response was not in `expected_ids`

async _filesync_read_buffered (*size*, *adb_info*, *filesync_info*)

Read *size* bytes of data from `self.recv_buffer`.

Parameters

- **size** (`int`) – The amount of data to read
- **adb_info** (`_AdbTransactionInfo`) – Info and settings for this ADB transaction
- **filesync_info** (`_FileSyncTransactionInfo`) – Data and storage for this FileSync transaction

Returns **result** – The read data

Return type `bytearray`

_filesync_read_until (*expected_ids*, *finish_ids*, *adb_info*, *filesync_info*)

Useful wrapper around `AdbDevice._filesync_read()`.

Parameters

- **expected_ids** (`tuple[bytes]`) – If the received header ID is not in `expected_ids`, an exception will be raised
- **finish_ids** (`tuple[bytes]`) – We will read until we find a header ID that is in `finish_ids`
- **adb_info** (`_AdbTransactionInfo`) – Info and settings for this ADB transaction
- **filesync_info** (`_FileSyncTransactionInfo`) – Data and storage for this FileSync transaction

Yields

- **cmd_id** (`bytes`) – The received header ID
- **header** (`tuple`) – TODO
- **data** (`bytearray`) – The received data

async _filesync_send (*command_id*, *adb_info*, *filesync_info*, *data=b''*, *size=0*)

Send/buffer FileSync packets.

Packets are buffered and only flushed when this connection is read from. All messages have a response from the device, so this will always get flushed.

Parameters

- **command_id** (*bytes*) – Command to send.
- **adb_info** (*_AdbTransactionInfo*) – Info and settings for this ADB transaction
- **filesync_info** (*_FileSyncTransactionInfo*) – Data and storage for this FileSync transaction
- **data** (*str, bytes*) – Optional data to send, must set data or size.
- **size** (*int*) – Optionally override size from len(data).

static **_handle_progress** (*progress_callback*)

Calls the callback with the current progress and total bytes written/received.

Parameters **progress_callback** (*function*) – Callback method that accepts filename, bytes_written, and total_bytes; total_bytes will be -1 for file-like objects.

async **_okay** (*adb_info*)

Send an b'OKAY' message.

Parameters **adb_info** (*_AdbTransactionInfo*) – Info and settings for this ADB transaction

async **_open** (*destination, adb_info*)

Opens a new connection to the device via an b'OPEN' message.

1. **_send()** an b'OPEN' command to the device that specifies the local_id
2. **_read()** a response from the device that includes a command, another local ID (their_local_id), and remote_id
 - If local_id and their_local_id do not match, raise an exception.
 - If the received command is b'CLSE', **_read()** another response from the device
 - If the received command is not b'OKAY', raise an exception
 - Set the adb_info.local_id and adb_info.remote_id attributes

Parameters

- **destination** (*bytes*) – b'SERVICE:COMMAND'
- **adb_info** (*_AdbTransactionInfo*) – Info and settings for this ADB transaction

Raises **adb_shell.exceptions.InvalidResponseError** – Wrong local_id sent to us.

async **_pull** (*filename, dest, progress_callback, adb_info, filesync_info*)

Pull a file from the device into the file-like dest_file.

Parameters

- **filename** (*str*) – The file to be pulled
- **dest** (*_io.BytesIO*) – File-like object for writing to
- **progress_callback** (*function, None*) – Callback method that accepts filename, bytes_written, and total_bytes
- **adb_info** (*_AdbTransactionInfo*) – Info and settings for this ADB transaction
- **filesync_info** (*_FileSyncTransactionInfo*) – Data and storage for this FileSync transaction

async _push (*datafile, filename, st_mode, mtime, progress_callback, adb_info, filesync_info*)

Push a file-like object to the device.

Parameters

- **datafile** (*_io.BytesIO*) – File-like object for reading from
- **filename** (*str*) – Filename to push to
- **st_mode** (*int*) – Stat mode for filename
- **mtime** (*int*) – Modification time
- **progress_callback** (*function, None*) – Callback method that accepts *filename, bytes_written, and total_bytes*
- **adb_info** (*_AdbTransactionInfo*) – Info and settings for this ADB transaction

Raises *PushFailedError* – Raised on push failure.

async _read (*expected_cmds, adb_info*)

Receive a response from the device.

1. Read a message from the device and unpack the *cmd, arg0, arg1, data_length, and data_checksum* fields
2. If *cmd* is not a recognized command in *adb_shell.constants.WIRE_TO_ID*, raise an exception
3. If the time has exceeded *total_timeout_s*, raise an exception
4. Read *data_length* bytes from the device
5. If the checksum of the read data does not match *data_checksum*, raise an exception
6. Return *command, arg0, arg1, and bytes (data)*

Parameters

- **expected_cmds** (*list[bytes]*) – We will read packets until we encounter one whose “command” field is in *expected_cmds*
- **adb_info** (*_AdbTransactionInfo*) – Info and settings for this ADB transaction

Returns

- **command** (*bytes*) – The received command, which is in *adb_shell.constants.WIRE_TO_ID* and must be in *expected_cmds*
- **arg0** (*int*) – TODO
- **arg1** (*int*) – TODO
- **bytes** – The data that was read

Raises

- **adb_shell.exceptions.InvalidCommandError** – Unknown command *or* never got one of the expected responses.
- **adb_shell.exceptions.InvalidChecksumError** – Received checksum does not match the expected checksum.

async _read_until (*expected_cmds, adb_info*)

Read a packet, acknowledging any write packets.

1. Read data via *AdbDevice._read()*

2. If a b'WRTE' packet is received, send an b'OKAY' packet via `AdbDevice._okay()`
3. Return the cmd and data that were read by `AdbDevice._read()`

Parameters

- **expected_cmds** (*list[bytes]*) – `AdbDevice._read()` with look for a packet whose command is in `expected_cmds`
- **adb_info** (`_AdbTransactionInfo`) – Info and settings for this ADB transaction

Returns

- **cmd** (*bytes*) – The command that was received by `AdbDevice._read()`, which is in `adb_shell.constants.WIRE_TO_ID` and must be in `expected_cmds`
- **data** (*bytes*) – The data that was received by `AdbDevice._read()`

Raises

- **adb_shell.exceptions.InterleavedDataError** – We don't support multiple streams...
- **adb_shell.exceptions.InvalidResponseError** – Incorrect remote id.
- **adb_shell.exceptions.InvalidCommandError** – Never got one of the expected responses.

`_read_until_close(adb_info)`

Yield packets until a b'CLSE' packet is received.

1. Read the cmd and data fields from a b'CLSE' or b'WRTE' packet via `AdbDevice._read_until()`
2. If cmd is b'CLSE', then send a b'CLSE' message and stop
3. If cmd is not b'WRTE', raise an exception
 - If cmd is b'FAIL', raise `AdbCommandFailureException`
 - Otherwise, raise `InvalidCommandError`
4. Yield data and repeat

Parameters **adb_info** (`_AdbTransactionInfo`) – Info and settings for this ADB transaction

Yields **data** (*bytes*) – The data that was read by `AdbDevice._read_until()`

`async _send(msg, adb_info)`

Send a message to the device.

1. Send the message header (`adb_shell.adb_message.AdbMessage.pack`)
2. Send the message data

Parameters

- **msg** (`AdbMessage`) – The data that will be sent
- **adb_info** (`_AdbTransactionInfo`) – Info and settings for this ADB transaction

`async _service(service, command, timeout_s=None, total_timeout_s=10.0, decode=True)`

Send an ADB command to the device.

Parameters

- **service** (*bytes*) – The ADB service to talk to (e.g., `b'shell'`)
- **command** (*bytes*) – The command that will be sent
- **timeout_s** (*float, None*) – Timeout in seconds for sending and receiving packets, or None; see `BaseHandle.bulk_read()` and `BaseHandle.bulk_write()`
- **total_timeout_s** (*float*) – The total time in seconds to wait for a `b'CLSE'` or `b'OKAY'` command in `AdbDevice._read()`
- **decode** (*bool*) – Whether to decode the output to utf8 before returning

Returns The output of the ADB command as a string if `decode` is `True`, otherwise as bytes.

Return type `bytes, str`

`_streaming_command` (*service, command, adb_info*)

One complete set of USB packets for a single command.

1. `_open()` a new connection to the device, where the destination parameter is `service:command`
2. Read the response data via `AdbDevice._read_until_close()`

Note: All the data is held in memory, and thus large responses will be slow and can fill up memory.

Parameters

- **service** (*bytes*) – The ADB service (e.g., `b'shell'`, as used by `AdbDevice.shell()`)
- **command** (*bytes*) – The service command
- **adb_info** (`_AdbTransactionInfo`) – Info and settings for this ADB transaction

Yields *bytes* – The responses from the service.

`_streaming_service` (*service, command, timeout_s=None, total_timeout_s=10.0, decode=True*)

Send an ADB command to the device, yielding each line of output.

Parameters

- **service** (*bytes*) – The ADB service to talk to (e.g., `b'shell'`)
- **command** (*bytes*) – The command that will be sent
- **timeout_s** (*float, None*) – Timeout in seconds for sending and receiving packets, or None; see `BaseHandle.bulk_read()` and `BaseHandle.bulk_write()`
- **total_timeout_s** (*float*) – The total time in seconds to wait for a `b'CLSE'` or `b'OKAY'` command in `AdbDevice._read()`
- **decode** (*bool*) – Whether to decode the output to utf8 before returning

Yields *bytes, str* – The line-by-line output of the ADB command as a string if `decode` is `True`, otherwise as bytes.

`async _write` (*data, adb_info*)

Write a packet and expect an Ack.

Parameters

- **data** (*bytes*) – The data that will be sent
- **adb_info** (*_AdbTransactionInfo*) – Info and settings for this ADB transaction

property available

Whether or not an ADB connection to the device has been established.

Returns `self._available`

Return type `bool`

async close()

Close the connection via the provided handle's `close()` method.

async connect (*rsa_keys=None, timeout_s=None, auth_timeout_s=10.0, total_timeout_s=10.0, auth_callback=None*)

Establish an ADB connection to the device.

1. Use the handle to establish a connection
2. Send a `b'CNXN'` message
3. Unpack the `cmd`, `arg0`, `arg1`, and `banner` fields from the response
4. If `cmd` is not `b'AUTH'`, then authentication is not necessary and so we are done
5. If no `rsa_keys` are provided, raise an exception
6. Loop through our keys, signing the last banner that we received
 1. If the last `arg0` was not `adb_shell.constants.AUTH_TOKEN`, raise an exception
 2. Sign the last banner and send it in an `b'AUTH'` message
 3. Unpack the `cmd`, `arg0`, and `banner` fields from the response via `adb_shell.adb_message.unpack()`
 4. If `cmd` is `b'CNXN'`, return `banner`
7. None of the keys worked, so send `rsa_keys[0]`'s public key; if the response does not time out, we must have connected successfully

Parameters

- **rsa_keys** (*list, None*) – A list of signers of type `CryptographySigner`, `PycryptodomeAuthSigner`, or `PythonRSASigner`
- **timeout_s** (*float, None*) – Timeout in seconds for sending and receiving packets, or `None`; see `BaseHandle.bulk_read()` and `BaseHandle.bulk_write()`
- **auth_timeout_s** (*float, None*) – The time in seconds to wait for a `b'CNXN'` authentication response
- **total_timeout_s** (*float*) – The total time in seconds to wait for expected commands in `AdbDevice._read()`
- **auth_callback** (*function, None*) – Function callback invoked when the connection needs to be accepted on the device

Returns Whether the connection was established (`AdbDevice.available`)

Return type `bool`

Raises

- **adb_shell.exceptions.DeviceAuthError** – Device authentication required, no keys available

- **adb_shell.exceptions.InvalidResponseError** – Invalid auth response from the device

async list (*device_path*, *timeout_s=None*, *total_timeout_s=10.0*)

Return a directory listing of the given path.

Parameters

- **device_path** (*str*) – Directory to list.
- **timeout_s** (*float*, *None*) – Expected timeout for any part of the pull.
- **total_timeout_s** (*float*) – The total time in seconds to wait for a b'CLSE' or b'OKAY' command in `AdbDevice._read()`

Returns **files** – Filename, mode, size, and mtime info for the files in the directory

Return type list[*DeviceFile*]

async pull (*device_filename*, *dest_file=None*, *progress_callback=None*, *timeout_s=None*, *total_timeout_s=10.0*)

Pull a file from the device.

Parameters

- **device_filename** (*str*) – Filename on the device to pull.
- **dest_file** (*str*, *file*, *io.IOBase*, *None*) – If set, a filename or writable file-like object.
- **progress_callback** (*function*, *None*) – Callback method that accepts filename, bytes_written and total_bytes, total_bytes will be -1 for file-like objects
- **timeout_s** (*float*, *None*) – Expected timeout for any part of the pull.
- **total_timeout_s** (*float*) – The total time in seconds to wait for a b'CLSE' or b'OKAY' command in `AdbDevice._read()`

Returns The file data if *dest_file* is not set. Otherwise, True if the destination file exists

Return type bytes, bool

Raises **ValueError** – If *dest_file* is of unknown type.

async push (*source_file*, *device_filename*, *st_mode=33272*, *mtime=0*, *progress_callback=None*, *timeout_s=None*, *total_timeout_s=10.0*)

Push a file or directory to the device.

Parameters

- **source_file** (*str*) – Either a filename, a directory or file-like object to push to the device.
- **device_filename** (*str*) – Destination on the device to write to.
- **st_mode** (*int*) – Stat mode for filename
- **mtime** (*int*) – Modification time to set on the file.
- **progress_callback** (*function*, *None*) – Callback method that accepts filename, bytes_written and total_bytes, total_bytes will be -1 for file-like objects
- **timeout_s** (*float*, *None*) – Expected timeout for any part of the push.
- **total_timeout_s** (*float*) – The total time in seconds to wait for a b'CLSE' or b'OKAY' command in `AdbDevice._read()`

async root (*timeout_s=None, total_timeout_s=10.0*)

Gain root access.

The device must be rooted in order for this to work.

Parameters

- **timeout_s** (*float, None*) – Timeout in seconds for sending and receiving packets, or None; see `BaseHandle.bulk_read()` and `BaseHandle.bulk_write()`
- **total_timeout_s** (*float*) – The total time in seconds to wait for a `b'CLSE'` or `b'OKAY'` command in `AdbDevice._read()`

async shell (*command, timeout_s=None, total_timeout_s=10.0, decode=True*)

Send an ADB shell command to the device.

Parameters

- **command** (*str*) – The shell command that will be sent
- **timeout_s** (*float, None*) – Timeout in seconds for sending and receiving packets, or None; see `BaseHandle.bulk_read()` and `BaseHandle.bulk_write()`
- **total_timeout_s** (*float*) – The total time in seconds to wait for a `b'CLSE'` or `b'OKAY'` command in `AdbDevice._read()`
- **decode** (*bool*) – Whether to decode the output to utf8 before returning

Returns The output of the ADB shell command as a string if `decode` is `True`, otherwise as bytes.

Return type bytes, str

async stat (*device_filename, timeout_s=None, total_timeout_s=10.0*)

Get a file's `stat()` information.

Parameters

- **device_filename** (*str*) – The file on the device for which we will get information.
- **timeout_s** (*float, None*) – Expected timeout for any part of the pull.
- **total_timeout_s** (*float*) – The total time in seconds to wait for a `b'CLSE'` or `b'OKAY'` command in `AdbDevice._read()`

Returns

- **mode** (*int*) – The octal permissions for the file
- **size** (*int*) – The size of the file
- **mtime** (*int*) – The last modified time for the file

streaming_shell (*command, timeout_s=None, total_timeout_s=10.0, decode=True*)

Send an ADB shell command to the device, yielding each line of output.

Parameters

- **command** (*str*) – The shell command that will be sent
- **timeout_s** (*float, None*) – Timeout in seconds for sending and receiving packets, or None; see `BaseHandle.bulk_read()` and `BaseHandle.bulk_write()`
- **total_timeout_s** (*float*) – The total time in seconds to wait for a `b'CLSE'` or `b'OKAY'` command in `AdbDevice._read()`
- **decode** (*bool*) – Whether to decode the output to utf8 before returning

Yields *bytes, str* – The line-by-line output of the ADB shell command as a string if `decode` is True, otherwise as bytes.

class `aio_adb_shell.adb_device.AdbDeviceTcp` (*host, port=5555, default_timeout_s=None, banner=None*)

Bases: `aio_adb_shell.adb_device.AdbDevice`

A class with methods for connecting to a device via TCP and executing ADB commands.

Parameters

- **host** (*str*) – The address of the device; may be an IP address or a host name
- **port** (*int*) – The device port to which we are connecting (default is 5555)
- **default_timeout_s** (*float, None*) – Default timeout in seconds for TCP packets, or None
- **banner** (*str, bytes, None*) – The hostname of the machine where the Python interpreter is currently running; if it is not provided, it will be determined via `socket.gethostname()`

`_available`

Whether an ADB connection to the device has been established

Type bool

`_banner`

The hostname of the machine where the Python interpreter is currently running

Type bytearray, bytes

`_handle`

The handle that is used to connect to the device

Type `TcpHandle`

class `aio_adb_shell.adb_device.DeviceFile` (*filename, mode, size, mtime*)

Bases: tuple

`_asdict()`

Return a new OrderedDict which maps field names to their values.

`_fields = ('filename', 'mode', 'size', 'mtime')`

`_fields_defaults = {}`

classmethod **`_make`** (*iterable*)

Make a new DeviceFile object from a sequence or iterable

`_replace` (***kws*)

Return a new DeviceFile object replacing specified fields with new values

property **`filename`**

Alias for field number 0

property **`mode`**

Alias for field number 1

property **`mtime`**

Alias for field number 3

property **`size`**

Alias for field number 2

```
class aio_adb_shell.adb_device._AdbTransactionInfo(local_id, remote_id,
                                                    timeout_s=None, total_timeout_s=10.0)
```

Bases: object

A class for storing info and settings used during a single ADB “transaction.”

Parameters

- **local_id** (*int*) – The ID for the sender (i.e., the device running this code)
- **remote_id** (*int*) – The ID for the recipient
- **timeout_s** (*float, None*) – Timeout in seconds for sending and receiving packets, or None; see `BaseHandle.bulk_read()` and `BaseHandle.bulk_write()`
- **total_timeout_s** (*float*) – The total time in seconds to wait for a command in `expected_cmds` in `AdbDevice._read()`

local_id

The ID for the sender (i.e., the device running this code)

Type int

remote_id

The ID for the recipient

Type int

timeout_s

Timeout in seconds for sending and receiving packets, or None; see `BaseHandle.bulk_read()` and `BaseHandle.bulk_write()`

Type float, None

total_timeout_s

The total time in seconds to wait for a command in `expected_cmds` in `AdbDevice._read()`

Type float

```
class aio_adb_shell.adb_device._FileSyncTransactionInfo(recv_message_format)
```

Bases: object

A class for storing info used during a single FileSync “transaction.”

Parameters **recv_message_format** (*bytes*) – The FileSync message format

recv_buffer

A buffer for storing received data

Type bytearray

recv_message_format

The FileSync message format

Type bytes

recv_message_size

The FileSync message size

Type int

send_buffer

A buffer for storing data to be sent

Type bytearray

send_idx

The index in `recv_buffer` that will be the start of the next data packet sent

Type `int`

can_add_to_send_buffer (*data_len*)

Determine whether `data_len` bytes of data can be added to the send buffer without exceeding `constants.MAX_ADB_DATA`.

Parameters `data_len` (*int*) – The length of the data to be potentially added to the send buffer (not including the length of its header)

Returns Whether `data_len` bytes of data can be added to the send buffer without exceeding `constants.MAX_ADB_DATA`

Return type `bool`

`aio_adb_shell.adb_device._open` (*name*, *mode*='r')

Handle opening and closing of files and IO streams.

Parameters

- **name** (*str*, *io.IOBase*) – The name of the file *or* an IO stream
- **mode** (*str*) – The mode for opening the file

Yields *io.IOBase* – The opened file *or* the IO stream

aio_adb_shell.adb_message module

Functions and an *AdbMessage* class for packing and unpacking ADB messages.

Contents

- *AdbMessage*
 - *AdbMessage.checksum*
 - *AdbMessage.pack()*
- *checksum()*
- *unpack()*

class `aio_adb_shell.adb_message.AdbMessage` (*command*, *arg0*, *arg1*, *data*=b'')

Bases: `object`

A helper class for packing ADB messages.

Parameters

- **command** (*bytes*) – A command; examples used in this package include `adb_shell.constants.AUTH`, `adb_shell.constants.CNXN`, `adb_shell.constants.CLSE`, `adb_shell.constants.OPEN`, and `adb_shell.constants.OKAY`
- **arg0** (*int*) – Usually the local ID, but `connect()` provides `adb_shell.constants.VERSION`, `adb_shell.constants.AUTH_SIGNATURE`, and `adb_shell.constants.AUTH_RSAPUBLICKEY`
- **arg1** (*int*) – Usually the remote ID, but `connect()` provides `adb_shell.constants.MAX_ADB_DATA`
- **data** (*bytes*) – The data that will be sent

arg0

Usually the local ID, but `connect()` provides `adb_shell.constants.VERSION`, `adb_shell.constants.AUTH_SIGNATURE`, and `adb_shell.constants.AUTH_RSAPUBLICKEY`

Type `int`

arg1

Usually the remote ID, but `connect()` provides `adb_shell.constants.MAX_ADB_DATA`

Type `int`

command

The input parameter `command` converted to an integer via `adb_shell.constants.ID_TO_WIRE`

Type `int`

data

The data that will be sent

Type `bytes`

magic

`self.command` with its bits flipped; in other words, `self.command + self.magic == 2**32 - 1`

Type `int`

property checksum

Return `checksum(self.data)`

Returns The checksum of `self.data`

Return type `int`

pack()

Returns this message in an over-the-wire format.

Returns The message packed into the format required by ADB

Return type `bytes`

`aio_adb_shell.adb_message.checksum(data)`

Calculate the checksum of the provided data.

Parameters **data** (*bytearray*, *bytes*, *str*) – The data

Returns The checksum

Return type `int`

`aio_adb_shell.adb_message.unpack(message)`

Unpack a received ADB message.

Parameters **message** (*bytes*) – The received message

Returns

- **cmd** (*int*) – The ADB command
- **arg0** (*int*) – TODO
- **arg1** (*int*) – TODO
- **data_length** (*int*) – The length of the data sent by the device (used by `adb_shell.adb_device._read()`)
- **data_checksum** (*int*) – The checksum of the data sent by the device

Raises `ValueError` – Unable to unpack the ADB command.

`aio_adb_shell.constants` module

Constants used throughout the code.

`aio_adb_shell.constants.AUTH_RSAPUBLICKEY = 3`
AUTH constant for `arg0`

`aio_adb_shell.constants.AUTH_SIGNATURE = 2`
AUTH constant for `arg0`

`aio_adb_shell.constants.AUTH_TOKEN = 1`
AUTH constant for `arg0`

`aio_adb_shell.constants.CLASS = 255`
From `adb.h`

`aio_adb_shell.constants.DEFAULT_AUTH_TIMEOUT_S = 10.0`
Default authentication timeout (in s) for `adb_shell.tcp_handle.TcpHandle.connect()`

`aio_adb_shell.constants.DEFAULT_PUSH_MODE = 33272`
Default mode for pushed files.

`aio_adb_shell.constants.DEFAULT_TOTAL_TIMEOUT_S = 10.0`
Default total timeout (in s) for `adb_shell.adb_device.AdbDevice._read()`

`aio_adb_shell.constants.FILESYNC_IDS = (b'DATA', b'DENT', b'DONE', b'FAIL', b'LIST', b'OKAY', b'OPEN', b'WRITE')`
Commands that are recognized by `adb_shell.adb_device.AdbDevice._filesync_read()`

`aio_adb_shell.constants.FILESYNC_ID_TO_WIRE = {b'DATA': 1096040772, b'DENT': 1414415684, b'DONE': 1145980243, b'FAIL': 1163086915, b'LIST': 1213486401, b'OKAY': 1213486401, b'OPEN': 1163086915, b'WRITE': 1163086915}`
A dictionary where the keys are the commands in `FILESYNC_IDS` and the values are the keys converted to integers

`aio_adb_shell.constants.FILESYNC_LIST_FORMAT = b'<5I'`
The format for FileSync “list” messages

`aio_adb_shell.constants.FILESYNC_PULL_FORMAT = b'<2I'`
The format for FileSync “pull” messages

`aio_adb_shell.constants.FILESYNC_PUSH_FORMAT = b'<2I'`
The format for FileSync “push” messages

`aio_adb_shell.constants.FILESYNC_STAT_FORMAT = b'<4I'`
The format for FileSync “stat” messages

`aio_adb_shell.constants.FILESYNC_WIRE_TO_ID = {1096040772: b'DATA', 1145980243: b'SEND', 1163086915: b'WRITE', 1213486401: b'DONE'}`
A dictionary where the keys are integers and the values are their corresponding commands (type = bytes) from `FILESYNC_IDS`

`aio_adb_shell.constants.IDS = (b'AUTH', b'CLSE', b'CNXN', b'OKAY', b'OPEN', b'SYNC', b'WRITE')`
Commands that are recognized by `adb_shell.adb_device.AdbDevice._read()`

`aio_adb_shell.constants.ID_TO_WIRE = {b'AUTH': 1213486401, b'CLSE': 1163086915, b'CNXN': 1163086915, b'OKAY': 1213486401, b'OPEN': 1163086915, b'SYNC': 1213486401, b'WRITE': 1163086915}`
A dictionary where the keys are the commands in `IDS` and the values are the keys converted to integers

`aio_adb_shell.constants.MAX_ADB_DATA = 4096`
Maximum amount of data in an ADB packet.

`aio_adb_shell.constants.MAX_PUSH_DATA = 2048`
Maximum size of a filesync DATA packet.

`aio_adb_shell.constants.MESSAGE_FORMAT = b'<6I'`

An ADB message is 6 words in little-endian.

`aio_adb_shell.constants.MESSAGE_SIZE = 24`

The size of an ADB message

`aio_adb_shell.constants.PROTOCOL = 1`

From adb.h

`aio_adb_shell.constants.SUBCLASS = 66`

From adb.h

`aio_adb_shell.constants.VERSION = 16777216`

ADB protocol version.

`aio_adb_shell.constants.WIRE_TO_ID = {1129208147: b'SYNC', 1163086915: b'CLSE', 11631540`

A dictionary where the keys are integers and the values are their corresponding commands (type = bytes) from

IDS

aio_adb_shell.exceptions module

ADB-related exceptions.

exception `aio_adb_shell.exceptions.AdbCommandFailureException`

Bases: `Exception`

A `b'FAIL'` packet was received.

exception `aio_adb_shell.exceptions.AdbConnectionError`

Bases: `Exception`

ADB command not sent because a connection to the device has not been established.

exception `aio_adb_shell.exceptions.DeviceAuthError` (*message, *args*)

Bases: `Exception`

Device authentication failed.

exception `aio_adb_shell.exceptions.InterleavedDataError`

Bases: `Exception`

We only support command sent serially.

exception `aio_adb_shell.exceptions.InvalidChecksumError`

Bases: `Exception`

Checksum of data didn't match expected checksum.

exception `aio_adb_shell.exceptions.InvalidCommandError` (*message, response_header, response_data*)

Bases: `Exception`

Got an invalid command.

exception `aio_adb_shell.exceptions.InvalidHandleError`

Bases: `Exception`

The provided handle does not implement the necessary methods: `close`, `connect`, `bulk_read`, and `bulk_write`.

exception `aio_adb_shell.exceptions.InvalidResponseError`

Bases: `Exception`

Got an invalid response to our command.

exception `aio_adb_shell.exceptions.PushFailedError`

Bases: `Exception`

Pushing a file failed for some reason.

exception `aio_adb_shell.exceptions.TcpTimeoutException`

Bases: `Exception`

TCP connection timed read/write operation exceeded the allowed time.

1.1.3 Module contents

ADB shell functionality.

This Python package implements ADB shell and FileSync functionality. It originated from [python-adb](#).

INSTALLATION

```
pip install aio-adb-shell
```

EXAMPLE USAGE

(Based on `androidthv/adb_manager.py`)

```
from aio_adb_shell.adb_device import AdbDeviceTcp
from aio_adb_shell.auth.sign_pythonrsa import PythonRSASigner

# Connect (no authentication necessary)
device1 = AdbDeviceTcp('192.168.0.111', 5555, default_timeout_s=9.)
await device1.connect(auth_timeout_s=0.1)

# Connect (authentication required)
with open('path/to/adbkey') as f:
    priv = f.read()
signer = PythonRSASigner('', priv)
device2 = AdbDeviceTcp('192.168.0.222', 5555, default_timeout_s=9.)
await device2.connect(rsa_keys=[signer], auth_timeout_s=0.1)

# Send a shell command
response1 = await device1.shell('echo TEST1')
response2 = await device2.shell('echo TEST2')
```
